

CIT2301 – Activity/Assignment

Student No.	20241116847	Student Name:	Jose, Krystoff		
Activity No.	4	Activity Name:	Allocation and De allocation	Date:	2026-05-29

For these illustrations, I'm using the scenario of organizing my bag, which is something I do in my day to day life since I constantly take things in and out of it. It's also something important for me to do because I bring my bag with me to campus nearly every day.

CIT2301 – Activity/Assignment

The illustration discusses how my different methods of organizing / placing things inside my bag is similar to memory allocation and its different techniques. I'm using liters (L) to show the volume of the bag, and each item is given its own value in liters. These values aren't accurate of course, they're a lot smaller than they are in actuality, but their sizes are exaggerated for the sake of the example being simple and easy to understand.

Afterwards, there's the next step of compaction, as you can see below.

Just like the previous one, this illustration discusses how I do "compaction" in my bag to fit something quite large into my bag. And once that is done, there's swapping.

Sometimes, I need to swap things around in my bag. But I can only really do it when there's free space or when the two items I want to swap take up the exact same amount of space.

This illustration is self explanatory and easy to understand. It uses my bag organization scenario as an allegory for swapping processes in memory.
